

# **GUAM CANCER FACTS & FIGURES**

2013 - 2017

#### Hafa Adai!

Storytelling has long been a part of Guam's rich and historic culture – used as a method to pass knowledge from one generation to the next, to educate and even to entertain. Access to accurate cancer data is vital to storytelling and this publication allows us to tell the story of the cancer experience in Guam.

Identifying the stories, like the patterns in incidence and mortality rates or the disparities that exist among cancer sites or ethnicities, helps us continue to shine a light on cancer as a public health priority. These data will serve as the basis for many working in public health in Guam – helping to inform policy decisions, develop and support programs, guide advocacy and education efforts and improve access and care for cancer patients and their families.

This third data report, produced in collaboration with the Guam Cancer Registry, the University of Guam Cancer Research Center, the Department of Public Health and Social Services and the various partners that comprise the Guam Comprehensive Cancer Control Coalition, is a testament to a 16-year partnership that has prioritized cancer control in Guam. Turning this data from stories into action will help the Coalition move towards its vision of Guam's people being "cancer-free, embracing a healthy lifestyle and living in a healthy environment."

Guam Comprehensive Cancer Control Coalition Interim Co-Chairs

Letter from the U54 Pacific Island Partnership for Cancer Health Equity (PIPCHE) Principal Investigators, Dr. Rachael T. Leon Guerrero and Dr. Margaret Hattori-Uchima

Hafa Adai!

Pacific Islanders and Filipinos, whose communities comprise the majority of Guam's population, remain underserved minorities with high rates of particular cancers and other non-communicable diseases; and cancer remains the second leading cause of death in Guam. Our underserved communities in Guam have a greater likelihood of developing and dying from certain cancers due to disparities in access to healthcare and certain lifestyle choices such as tobacco and alcohol use, physical activity, and diet. The 3<sup>rd</sup> Guam Cancer Facts and Figures, covering data for the years 2013—2017, is evidence of the sustained commitment from the various cancer prevention and control stakeholders within our community to combat a major cause of premature mortality in our island using data-driven strategies and approaches.

This report provides data on cancer incidence, mortality, its socio-demographic correlates and its risk factors. Building on the 1st and 2nd Guam Cancer Facts and Figures (2003—2007 and 2008—2012, respectively), we have sufficient data to examine trends and to determine which areas in cancer prevention and control stand out as service and resource priorities. By translating these data into action through policies and programs, we hope to reverse the growing burden of cancer in Guam.

The University of Guam, Guam Cancer Registry, and Guam Department of Public Health and Social Services, Comprehensive Cancer Control Program will continue to work closely with the Guam Comprehensive Cancer Control Coalition and the Guam NCD Consortium and other community stakeholders to fully utilize these data to guide policy and program decisions in a strategic approach to cancer control and prevention.

#### **ACKNOWLEDGEMENTS**

A multitude of partnerships and people have committed their time and efforts to making this data available and accessible to our communities. The Guam Comprehensive Cancer Control Coalition, via the Data and Research Action Team (DRAT), has worked closely with the Department of Public Health and Social Services' (DPHSS) Guam Comprehensive Cancer Control Program (GCCCP), the University of Guam Cancer Research Center (UOG CRC) Guam Cancer Registry (GCR), Biostatistics Core, and Community Outreach Core (COC), the American Cancer Society (ACS) Guam Chapter, Guam Cancer Care, and other data stakeholders to produce this report. This publication is the third in the series of Guam Cancer Facts and Figures since it began in 2009. It is made possible by long-time partnerships in cancer control across service providers, researchers, and community organizations, and their unwavering dedication to addressing cancer in our populations. This publication is based on Guam cancer data from the GCR that was submitted by Ms. Renata Bordallo and her team to the Pacific Regional Central Cancer Registry (PRCCR). Risk factor prevalence data were taken from the Guam Behavioral Risk Factor Surveillance System (BRFSS), administered by DPHSS, and the Guam Youth Risk Surveillance System (YRBSS) administered by the Guam Department of Education (GDOE). Data analysis and results were calculated by the UOG CRC Biostatistics Core led by Dr. Grazyna Badowski. The lead author for the report was Dr. Delores Lee (Todu Guam Foundation). Dr. Tressa P. Diaz, UOG CRC COC and lead for DRAT, was in charge of overall production, editing, and data collation. Project support was provided by Mr. Lawrence Alam and Ms. Vivian Pareja at DPHSS GCCCP. Various individuals who contributed to this report include the following:

Name	Institution/Agency	Name	Institution/Agency
Dr. Delores Lee	Todu Guam Foundation	Ms. Vivian Pareja	DPHSS, GCCCP
Dr. Tressa P. Diaz	UOG CRC COC, DRAT	Mr. Lawrence Alam	DPHSS, GCCCP
Dr. Grazyna Badowski	UOG CRC Biostatistics, DRAT	Dr. Rachael Leon Guerrero	Office of Research & Sponsored Programs
Ms. Renata Bordallo	UOG CRC GCR, DRAT	Ms. Alicia Borja	UOG CRC
Ms. Angelina Mummert	UOG CRC COC, DRAT	Dr. Ana Joy Mendez	UOG School of Health Nursing, DRAT
Ms. Harmony Palaganas	UOG CRC COC, DRAT	Ms. Olynne Rhoads	Guam Cancer Care, DRAT
Mr. Rodney Teria	UOG CRC Biostatistics	Ms. Dahlia Sapalo	Guam Cancer Care, DRAT
Ms. Louis Dulana	UOG CRC Biostatistics	Ms. Melliza Young	Guam Regional Medical City, DRAT
Ms. Naomi Del Mundo	UOG CRC GCR	Ms. Marisha Artero-Perez	GCCCC Steering Committee, ACS
Ms. Lymona Refugia	UOG CRC GCR, PRCCR	Dr. Yvette Paulino	GCCCC Steering Committee, UOG School of Health

This publication was funded in part by the Research Corporation of the University of Guam. It was also supported by the National Cancer Institute (NCI) of the National Institutes of Health under PACHE Award No. U54CA143728 awarded to the University of Guam Cancer Research Center, and the Centers for Disease Control and Prevention (CDC) Cooperative Grant Agreement No. 1 NU58DP007176-01-00 awarded to the Guam Department of Public Health and Social Services. The content is solely the responsibility of the authors and does not necessarily represent the official views of the National Institutes of Health, Centers for Disease Control and Prevention, the Guam Department of Public Health and Social Services, or the University of Guam.

## INTRODUCTION

## **GUAM CANCER REGISTRY**

The Guam Cancer Registry (GCR) is a population-based registry tasked with recording all cancer cases occurring among residents of Guam. It was established by law in 1998 by the 24th Guam Legislature under the Department of Public Health and Social Services (DPHSS). Funding from the National Institute of Health (NIH)/National Cancer Institute (NCI) to support the registry was obtained in 2004 through the University of Hawai'i Cancer Research Center. Shortly after, the University of Guam (UOG) and DPHSS formalized a joint operation, and the GCR became a unit of the Cancer Research Center of Guam in 2005 - now the Research Corporation of the University of Guam (RCUOG). In 2006 the GCR was awarded full-member status in the North American Association of Central Cancer Registries (NAACCR). Regulations governing the GCR were expanded in October 2010, with approval by the Guam Legislature, to include mandatory reporting of new cancer cases by non-medical providers of services to persons diagnosed with cancer. DPHSS and UOG continue to cooperatively run the registry under Public Law 30-80 that provides for the exchange of information and sharing of resources to support GCR operations.<sup>1</sup>

GCR operates under stringent national standards and collects detailed information on all cancer cases (as well as benign brain/CNS tumors) diagnosed in Guam residents. This information is reported by Guam's hospitals, laboratories, oncology clinics, insurance companies, and nonprofits – all agencies and organizations that provide services to Guam cancer patients. GCR is required to collect follow-up information for cancer patients in its database and works closely with DPHSS's Office of Vital Statistics. All data collected on cancer patients is kept strictly confidential; no personal health information is released to the public. <sup>2</sup>

#### PACIFIC REGIONAL CENTRAL CANCER REGISTRY\*

The Pacific Regional Central Cancer Registry (PRCCR) oversees the systematic and accurate collection of cancer data in all US-affiliated Pacific Island (USAPI) jurisdictions, including Guam. It was initiated by the Cancer Council of the Pacific Islands (CCPI) in 2003 to mitigate the lack of quality cancer data in the region. The University of Hawai'i John A. Burns School of Medicine (JABSOM), Department of Family Medicine and Community Health, is the designated official agent on behalf of the USAPI jurisdictions to plan and implement the Centers for Disease Control (CDC) National Program of Cancer Registries (NPCR) in the USAPI. GCR and most USAPI jurisdictions began reporting to the CDC NPCR in December 2009 through PRCCR. In addition to the standard data variables that are reported to CDC by cancer registries nationwide, the CCPI, as Advisory Board to PRCCR, added collection of data on screening, prevention, and Non-Communicable Disease (NCD) risk factors. Responsibilities of PRCCR include:

- To develop cancer registries where the data is controlled and owned by each individual jurisdiction and to ensure the data are useful for local program planning and evaluation as well as monitoring local cancer trends over time
- To develop the systems and policies which ensure proper identification, reporting and recording of all cancers in each USAPI jurisdiction
- To develop a cancer registration system that is sophisticated, yet flexible and sustainable, i.e., take into account the relative case load of cancers in each USAPI, the availability of trained personnel and the local ability to support such a system
- To link the individual USAPI cancer registries, comprehensive cancer control efforts, related non-communicable disease (NCD) efforts and public health system strengthening efforts in a manner that allows for economies of scale, standardized reporting and "speaking with one voice" for the USAPI

PRCCR assists USAPI registries through quarterly training, sharing program and technical resources, limited unding for personnel and equipment, and consultation and advocacy. As a Central Registry, it answers NPCR's annual Calls for Data, editing and submitting cancer data from all the USAPI registries to CDC.

#### METHODS AND APPROACH

Previous publications of Guam Cancer Facts & Figures (GCFF) presented information from 1998- 2002, 2003-2007, and 2008-2012, and were based on data provided by the Guam Cancer Registry (GCR). This publication is based on Guam cancer data submitted by GCR to the Pacific Regional Central Cancer Registry (PRCCR) and edited for quality assurance. PRCCR edits all cases received by GCR and other United States-Affiliated Pacific Island (USAPI) registries prior to its annual submission of cancer data to CDC.

<sup>\*</sup> The following is adapted from Cancer in the USAPI 2007-2018. $^{4-5}$ 

## **INCIDENCE DATA (NEW CANCERS)**

Guam cancer Incidence Data for this report was supplied by PRCCR. Guam cancers diagnosed between 2013-2017 were extracted from the PRCCR database on February 8, 2021. This report includes only invasive cancer cases, edited by PRCCR for quality and completeness. Earlier publications of GCFF included some incomplete (not fully abstracted) and some "in situ" (noninvasive) cancer cases. The change in data source and the consequent exclusion of incomplete and non-invasive cases may contribute to a decrease in cancer incidence for the time period discussed in this publication.

Included in this report are sections for specific cancers of interest, such as breast and cervix. As an exception, these sections will include additional counts of in situ and/or pre-cancerous lesions due to their relevance to cancer screening and control.

# **MORTALITY DATA (CANCER-RELATED DEATHS)**

Guam cancer mortality data in this report was extracted from GCR's database on November 30, 2020. Cancer-related deaths occurring between 2013-2017 were included. Cancer cases that were not in PRCCR's database were excluded to ensure quality. The authors of this report agreed that using GCR (versus PRCCR) as the primary source for mortality would ensure a more accurate count. Two major factors supported this:

- There is a delay in time from when GCR updates the Vital Status of its exported cases compared to when PRCCR receives the information and updates its cases.
- GCR started abstracting cancer cases in 1998 (known as its Reference Date). PRCCR's Reference Date is 2007. Deaths of residents diagnosed with cancer prior to 2007 would not be in the PRCCR database, resulting in an undercount.

The primary sources of death data are death certificates (D.C.s) provided monthly by the DPHSS Office of Vital Statistics to GCR. In line with national standards, only cases with cancer listed as the "immediate" or "underlying" cause of death are included in the mortality count<sup>6</sup>. This is consistent with Guam cancer mortality data from 1998-2012.

A small portion of deaths of persons with cancer are based solely on an online or published Obituary, lacking critical information that would be found in a death certificate, such as cause(s) of death.

### **STAGING**

Staging data for cancer cases is vital data to have for patients, physicians/oncologists, and for community cancer prevention and screening programs. In short, the stage of a malignant tumor tells how much or little it has grown and/or spread at the time of diagnosis. It directly correlates with the types of treatment a doctor may recommend. Cancer registries use standardized codes to identify the stage of a cancer at the time of diagnosis. While various staging systems have been used in past years, such as Collaborative Staging and now American Joint Committee on Cancer (AJCC) Staging, Surveillance, Epidemiology, and End Results (SEER) Summary Stage has remained the most basic staging system7. Its five stages include:

- **In situ** indicates a tumor that is early or "non-invasive" cancer that is present only in the layer of cells in which it began. An in-situ lesion can only be diagnosed by microscopic examination.
- **Localized** indicates a cancer that is limited to the organ in which it began, without evidence of spread. It can still be considered "localized" as long as there is no extension beyond the outer limits of the primary organ, with no evidence of metastasis elsewhere within the body.
- Regional indicates a cancer that has spread beyond the original (primary) site to nearby lymph nodes or organs and tissues.
- **Distant** indicates a cancer that has spread from the primary site to distant organs or distant lymph nodes or by implantation metastasis.
- Unstaged or Unknown indicates there is a cancer, but insufficient information exists to determine the stage or extent of the disease at diagnosis.<sup>7</sup>

In this publication, SEER Summary Stage for invasive cancers were analyzed and categorized as: Early (localized), Late (regional and distant spread), and Unstaged (unknown stage).

There are many reasons for a registry to have a large number of unknown or unstaged cancers. Some cancers, such as breast, cervix, and colorectal, are easier to screen for and identify at an earlier stage due to specific symptomology. Other cancers, such as lung, pancreas, and ovarian, have more generalized symptoms and fewer screening tools. Some persons with a new cancer diagnosis may lack health insurance, money, and/or transportation to complete the required tests to adequately stage their cancer. And cancer registries often do not have all documents needed to stage a cancer. For example, Guam and PIJ registries have a high number of abstracts built from a single pathology report or a death certificate; thus, the cancer is reported but unstaged.

# RACE/ETHNICITY DATA

Race and ethnicity are coded according to standardized codes used in CDC's Abstract Plus software, and national registry standards. 7 Ethnic/race analysis includes five (5) groups with the largest number of cancer cases in Guam: CHamoru, Filipino, Micronesian (other than CHamoru), Asian (other than Filipino), and Caucasian. They are the same as in previous publications of Guam Cancer Facts & Figures. When a person is documented to have two or more ethnicities/races, only the primary ethnicity/race is used in the analysis.

"CHamoru" is used in place of "Chamorro" in accordance with Guam Public Law 33-236 passed in 2018.8 CHamoru include persons in Guam whose primary ethnic identity is CHamoru, and CHamorus from the Commonwealth of the Northern Mariana Islands (CNMI) and elsewhere who were residents of Guam at the time of their cancer diagnosis. "Micronesian" includes persons from all islands in Micronesia (other than CHamorus) such as the Federated States of Micronesia (Chuuk, Yap, Pohnpei, Kosrae), Republic of Belau, and Republic of the Marshall Islands. Carolinians from the CNMI are included as Micronesians. The data analysis did not subdivide Micronesians into various ethnicities because numbers were too small for analysis. "Asian" includes all ethnicities originating in Asia, excluding the Philippines. While GCR collects more specific Asian group information (e.g. Japanese, Chinese, Korean, etc.), small numbers preclude their analysis.

# LIMITATIONS AND CONSIDERATIONS WHEN INTERPRETING CANCER DATA IN SMALL POPULATIONS

Guam's cancer population is small relative to other states and countries with much larger general populations. This makes statistical analysis of cancer cases in Guam and other Pacific Islands a challenge, and interpretation of findings just as challenging. GCR analyzes its cancer data in five-year aggregate periods to strengthen the statistical validity of incidence and mortality rates. Interpreting increases and decreases in case numbers and rates should be done with caution, as other factors may influence fluctuating case counts. These include:

Case reporting – The frequency, consistency, amount of data, and timeliness of case reporting from oncology clinics, hospitals, labs, radiology and surgical centers, non-profits, and insurance companies vary greatly. Staff changes affect the knowledge base about registry obligations, and shifting workloads affect cancer reporters' ability and willingness to report.

Active case collection and follow-back – Data quality increases when registry staff have direct clinic/agency access to collect needed documents and obtain follow-up information for cases. Mandated reporters' confidentiality concerns and misunderstanding of HIPAA regulations may delay timely access to records. Availability of registry staff to do this time-intensive work also varies.

A fragmented health care system and off-island care – Utilization of varied health care systems challenge GCR's ability to account for all cancer cases diagnosed in Guam residents. Complete documentation of cancer diagnoses and treatments may be "lost in the process," adversely affecting Continuity of Care. This is not unique to Guam or the USAPI – but is a national problem.

The Department of Defense (DOD) and the Veterans Administration (VA) systems — The DOD and VA have separate systems for cancer registration, and do not routinely share cancer data with non-DOD registries. Veterans and their dependents do at times access civilian oncology and other medical services, which then may be picked up by GCR.

#### **CANCER IN GUAM: AN OVERVIEW**

# SHOULD OUR COMMUNITY STILL BE CONCERNED ABOUT CANCER?

Cancer remains the second leading cause of death in Guam, accounting for 16.9% of all deaths or about 1 in every 6 deaths in 2017 (Table 1).

Table 1. Top Ten Causes of Death, Guam, 2017

Rank	Cause of Death	Number of Deaths	Percent of all Deaths
1	Cardiovascular Diseases	339	33.7
2	Malignant Neoplasms	170	16.9
3	Septicaemia	50	5.0
4	Cerebrovascular Diseases	47	4.7
5	Diseases of the Digestive System	45	4.5
6	Diseases of the Genitourinary System	45	4.5

# GUAM CANCER FACTS & FIGURES 2013-2017

Data from 2013-2017 suggests that cancer incidence has declined since the 2008-2012 time period (Figure 1) indicating a 13.9% decrease in incidence rate. This may be in part due to the data from 2013-2017 time period including only invasive cases. Despite the decrease relative to the 2008-2012 time period, incidence is about the same as that documented for the 1998-2002 and 2003-2007 time periods (Figure 1). Current data indicates an average of 1 person diagnosed with cancer every 1.1 days.

2000 400 Age-adjusted rate per 100,000 300 1500 Number of Cases 200 1000 500 100 0 0 2013-2017 1998-2002 2003-2007 2008-2012 Cases 1333 1580 1904 1587 Incidence 272 276.9 325.1 279.9

Figure 1. Trends in Cancer Incidence Counts and Rates, All Cancers, Guam: 1998-2017

1998 - 2012: All cancer cases; 2013-2017: invasive cases only.

Rates are per 100,000 and age-adjusted to the 2000 US Standard population.

Guam Cancer Coalition's Annual Cancer Retreat (2019)

The number of cancer deaths increased relative to the previous time periods reported (Figure 2). Mortality rates (165.57) increased 21% from 2008-2012 (136.7). This translates to an average of 1 person dying of cancer every 2.3 days.

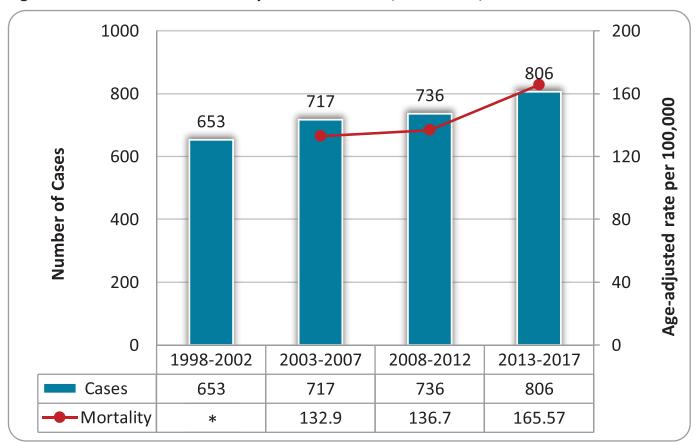

Figure 2. Trends in Cancer Mortality Counts and Rates, All Cancers, Guam: 1998-2017

1998-2012: All cancer cases, 2013-2017: Invasive cases only.

Rates are per 100,000 and are age-adjusted to the 2000 U.S. standard population.

Source Years 2013-2017: UOG Research Center, PRCCR.

Source Years 2003-2012: Guam Cancer Facts and Figures 2003-2007, Guam Cancer Facts and Figures 2008-2012.

On average, in Guam, 1 person is diagnosed with cancer every 1.1 days and dies of cancer every 2.3 days.

<sup>\*</sup>Data not available for this period.

#### **MOST COMMON CANCERS IN GUAM**

The five most common cancer sites for new cancer cases are breast, lung and bronchus, colorectal, prostate, and liver. Colorectal sites indicate cancers in the colon, rectum, and/or anus. Four cancer sites – breast, lung and bronchus, colorectal, and prostate – account for about 55% of all new cancer cases (Table 2). The majority of cancer deaths are from lung and bronchus, colorectal, liver, and breast, as these sites account for about 56% of all cancer deaths (Table 2).

Table 2. Top Ten Cancer Cases, Guam, 2013-2017

,,	, ,				
Cancer Sites	Incidence Counts (New Cases)	Percent of Total Cancer Incidence		Cancer Sites	Mortality Counts (Death)

Although the incidence for all sites decreased in 2013-2017 compared to 2008-2012, the relative contribution of breast, colorectal, and lung and bronchus cancer to overall cancer incidence increased in 2013-2017 compared to 2008-2012. The relative contribution of prostate cancer slightly increased while the relative contribution for liver cancer slightly decreased for the same time periods (Table 3A).

#### THE DEMOGRAPHICS OF CANCER

### Cancer and Age

A person's risk of developing cancer increases with age. Both the number of cancer cases and cancer incidence increased with age (Figure 3, Table 4). About 1.5% of new cancer cases were diagnosed in persons aged 0-24 years old in Guam. In contrast, about 43% of new cases were diagnosed in persons aged 65 and older in Guam (Table 4).

690 700 600 **Number of Cases** 500 400 300 227 208 163 200 104 91 100 43 20 17 10 0 Age 0- Age 5-Age Age Age Age Age Age Age 10-14 15-19 20-24 25-29 30-34 35-39 40-44 45-49 50-54 55-59 60-64 and above Age Groups

### **CANCER IN CHILDREN AND YOUNG ADULTS**

There were 24 cancer cases in persons aged 0-24 years old in Guam (Figure 4). Most of the cases (about 42%) were in the group aged 20-24 years old. The second most cases were seen in the age group 0-4 years old at 25%. At 21%, the third highest number of cases was in the group aged 15-19 years old.

Figure 4. Age Distribution of Childhood and Young Adult Cancers, Guam, 2013-2017

Invasive cases only.

Source: UOG Cancer Research Center, PRCCR.

Nine new cases of cancer were reported in children aged 0-14 years old in Guam (Table 5). Leukemia accounted for the majority of these cases at 44%. Kidney and ureter cancer was the second most common site, accounting for 22% of these cases. Brain, ovary, and liver cancer each accounted for 11% of these cases.

Four children aged 0-14 years old died from cancer in Guam (Table 5). Leukemia, kidney and ureter cancer, brain cancer, and liver cancer each accounted for one death in this age group.

Table 5. Cancer incidence and mortality in children aged 0-14 years, Guam, 2013-2017

*Invasive cases only.* 

Source: UOG Cancer Research Center, PRCCR.

In teens and young adults aged 15-24 years old in Guam, 15 new cases of cancer were reported (Table 6). Thyroid cancer accounted for the majority of cases at about 27%. Leukemia, colorectal cancer, and testicular cancer each accounted for about 13% of cases. The distribution was even for the other cancers listed in Table 6, as each site accounted for one new case during this time period.

Four teens and young adults aged 15-24 years old died from cancer in Guam (Table 6). Leukemia was the cause for two deaths, and cancer of the kidney and ureter and cancer of the testis was the cause of one death each.

Table 6. Cancer incidence and mortality in adolescents and young adults aged 15-24 years, Guam, 2013-2017

#### Cancer and Sex

From 2013-2017, 1,587 people in Guam were diagnosed with cancer (Table 2) and 806 people died from cancer (Table 2). As per the 2010 Census, Guam had a total population of 159,358 with 81,568 males (51%) and 77,790 females (49%).

Guam Comprehensive Cancer Control – Breast Cancer Awareness (2016)

Figure 5. Guam Total Population by Sex, 2010 Census Guam Demographic Profile

Source: 2010 Census Guam Demographic Profile Summary File.

Prepared by Guam State Data Center of Bureau of Statistics and Plans. December 2012.

In comparing incidence by sex for the 2013-2017 time period, males have an incidence rate of about 306 per 100,000 and females have an incidence rate of about 261 per 100,000 (Figure 6A). In comparison to the 2008-2012 time period, the number of new cases in 2013-2017 decreased for males by about 14% (931 vs 804 cases) and by 19.5% for females (973 vs 783 cases) (Figure 6B).

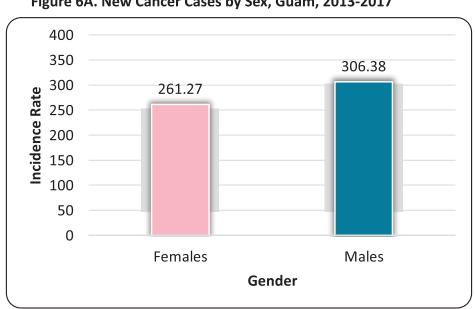

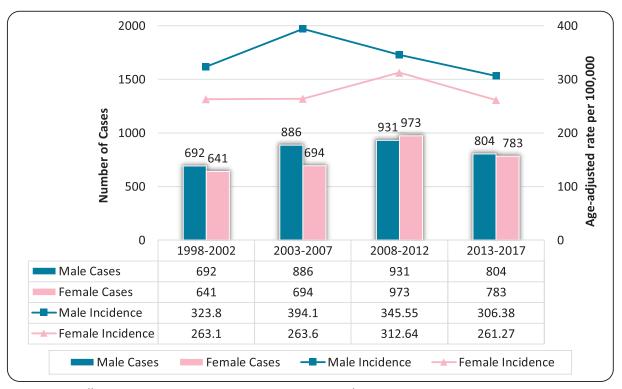

Figure 6A. New Cancer Cases by Sex, Guam, 2013-2017

Guam Comprehensive Cancer Control Program - Breast Cancer Awareness Month (2019)

Cancer sites with the highest incidence differ by sex. The prostate was the most frequently reported site of new cancer cases in males whereas the breast was the most frequently reported site for new cancer cases in females. Lung and bronchus cancer has the second highest incidence in both males and females. Colorectal cancer was another common cancer diagnosis for both sexes. Included in the five most common cancer sites for new cancer cases in males were liver cancer and mouth and pharynx cancer. Uterine and cervical cancers were among the five most common cancer sites for new cases in females (Table 7).

Table 7. Ten top sites of new cancer cases by sex, Guam, 2013-2017

	Males				Fe	males

After lung and bronchus cancer, the most common sites for cancer deaths in Guam differ by sex. Liver, prostate, and colorectal cancer were among the leading causes of cancer deaths in males. Breast and colorectal were among the leading causes of cancer death in females (Table 8).

More new cancer cases and deaths were seen in males than females in Guam. This correlates with males having a higher prevalence of risk factors for cancer. Relative to females, males in Guam had a higher prevalence of smoking, heavy drinking, and obesity (Figure 8).

Figure 8. Cancer Risk Factors Prevalence by Sex, Guam, 2015

# Cancer and Ethnicity

The 2010 Census data indicates the top five ethnic/racial groups in Guam, excluding 2 or more ethnic origins or races, were CHamoru, Filipino, Micronesian, White, and Asian (other than Filipino) (Figure 9).

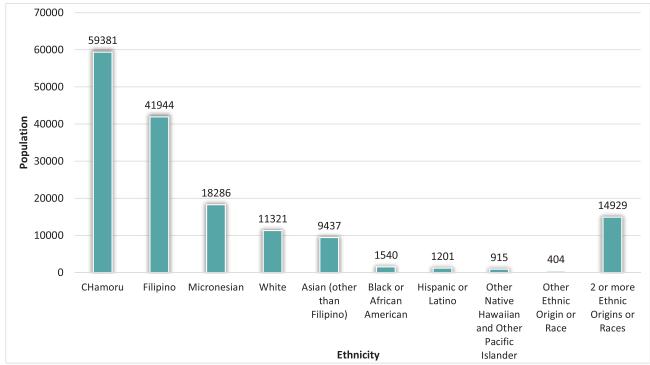

Figure 9. Guam Population by Ethnic Origin or Race, 2010

Prepared by Guam State Data Center Bureau of Statistics and Plans, December 2012. Source: 2010 Census Guam Demographic Profile Summary File.

Table 9 shows the mean annual age-adjusted cancer incidence rates for all cancer sites for these 5 major ethnic/race groups from 1998-2017. Table 9 also shows total Guam incidence mean annual rate versus the total U.S. incidence mean annual rate for the time period 2013- 2017. A table showing this information for different cancer sites by ethnicity can be found in the appendix (Table 41).

Table 9. Comparison of Guam and U.S. Mean Annual Age-Adjusted Cancer Incidence Rates by Ethnicity, 1998-2017

Cancer Site	CHamoru	Filipino	Micronesia	Asian (other than Filipino)	Caucasian	Total Guam	Total U.S.
All Cancers							
1998-2002	406.8	215.7	401.5	149.7	585.4	272.0	479.5
2003-2007	395.7	218.6	598.3	408.1	531.2	276.9	458.4
2008-2012	384.5	206.0	414.7	199.6	365.1	325.1	456.7

1998-2012: All cancer cases, 2013-2017: Invasive cases only.

Rates are per 100,000 and are age-adjusted to the 2000 U.S. standard population.

Source Years 2013-2017: UOG Cancer Research Center, PRCCR.

Source Years 2003-2012: Guam Cancer Facts and Figures 2003-2007, Guam Cancer Facts and Figures 2008-2012.

Table 10 shows the Guam mean annual age-adjusted cancer mortality rates for selected sites by ethnicity for 2013-2017. The ethnic/race groups reported in Table 10 are the top 5 ethnic/race groups in Guam as identified by the 2010 Census, excluding the category of 2 or more ethnic origins or races (Figure 9). Micronesians and CHamorus have the highest mortality rates for all cancers (Table 10).

Table 10 also compares the 2010 U.S. aggregate age adjusted cancer mortality rate versus the total Guam rate. The total Guam mean annual age-adjusted cancer mortality rate was higher than the U.S. aggregate age-adjusted cancer mortality rate for lung and bronchus cancer, prostate cancer, breast cancer, colon-rectum-anus cancer, liver cancer, cervical cancer, stomach cancer, mouth and pharynx cancer, and nasopharynx cancer (Table 10).

A table showing the Guam mean annual age-adjusted cancer mortality counts for selected sites by ethnicity for 2013-2017 can also be found in the appendix (Table 42).

Micronesian Resource Center One-Stop Shop Group Photo (2010)

<sup>\*</sup>Rates are suppressed if fewer than five (5) cases were recorded in the cancer site category.

## CANCER DISPARITIES AND SOCIAL DETERMINANTS OF HEALTH

#### **CANCER DISPARITIES**

Cancer impacts all populations, but it does not affect everyone equally. Some communities are more heavily impacted than others due to social, environmental, and economic disadvantages, and they carry a disproportionate burden of cancer compared with other groups. The National Cancer Institute defines cancer disparities as differences between groups in cancer measures such as deaths, new and existing cases, cancer-related health complications, financial burden, screening rates, stage of diagnosis, and years of survival after diagnosis. Although mentioned in previous sections, key cancer disparities in Guam are summarized below.

- By sex, males had a 17% higher age-adjusted rate of overall cancer incidence than females. Compared to females, males had higher percentages of lung (20.0 vs. 12.8), colorectal (13.2 vs. 9.1), and liver cancer (7.6 vs. 2.2) incidence. Females had higher rates in thyroid cancer.
- Males had an approximately 45% higher age-adjusted rate of cancer mortality than females. Of the 806 cancer deaths in this time period, 56% occurred in males and 44% occurred in females. Specifically, males had higher percentages of cancer deaths in lung and bronchus, liver, prostate, mouth & pharynx, leukemia, kidney and ureter, non-Hodgkin lymphoma, and nasopharynx cancers.
- Females had higher percentages of death in specific cancers such as breast, pancreas, and stomach cancers.
- By ethnicity, Micronesians had the highest age-adjusted cancer incidence rates (438.0) compared to the
  overall Guam population (279.9). They had the highest incidence rates specifically in stomach, pancreas,
  liver, lung and bronchus, breast, cervix, uterus, and prostate cancers. Their rates for liver cancer
  incidence were almost five times higher than the U.S. and three times higher than the incidence rate in
  Guam.
- CHamorus had the highest age-adjusted incidence rates in cancers of the nasopharynx (the upper part of the throat that starts at the back of the nasal cavity), esophagus, urinary bladder, and leukemia. Their rate in nasopharynx cancers was nine times that of the U.S. They have the second highest rates in Guam for stomach, colorectal, pancreas, liver, lung and bronchus, cervix, and uterine cancers. Liver cancer incidence for CHamorus was almost three times the U.S. rate.
- Caucasians had the highest rates of age-adjusted cancer incidence in cancers of the mouth and pharynx, colorectal, and Non-Hodgkin lymphoma. They had the second highest rates in breast and prostate cancers.
- Micronesians had the highest age-adjusted cancer mortality rates in all cancers combined (336.1) and twice as high as the mortality rates for all cancers in Guam (165.5) and the U.S. (158.3).
- Micronesians (86.3) and CHamorus (66.2) had higher rates of death in lung and bronchus cancer than in the U.S. (40.2) and the total Guam population (46.9).

# GUAM CANCER FACTS & FIGURES 2013-2017

- Micronesians had the highest age-adjusted cancer mortality rates in lung and bronchus, liver, breast,
  pancreas, cervix, stomach, and mouth & pharynx cancers in Guam. Rates of death compared to the U.S.
  were twice as high for lung and bronchus cancer, five times higher for breast, liver, and mouth and
  pharynx cancers, six times higher for stomach cancer, and almost ten times higher for cervical cancer.
- CHamorus had higher age-adjusted cancer mortality rates in lung and bronchus, prostate, breast, colorectal, liver, cervix, leukemia, stomach, mouth and pharynx, esophagus, and nasopharyngeal cancers compared to the U.S. The starkest comparisons are that CHamorus had death rates twice as high in prostate, stomach, and mouth and pharynx cancers, three times higher in cervical cancer, four times higher in liver cancer, and nineteen times higher in nasopharynx cancer than the U.S. population.

#### SOCIAL DETERMINANTS OF HEALTH

Central to the issue of cancer and cancer disparities are social determinants of health (SDOH).<sup>10</sup> Social determinants of health are the conditions that people are born in to, in which they live, work, and grow, and the wider set of systems that affect their lives, health risks, and health outcomes.<sup>11</sup> Examples of conventional social determinants include but are not limited to income, education, housing quality, employment status, health insurance status, racism, and discrimination.<sup>12–14</sup> Some examples of social determinants of health in Micronesia are climate change, U.S. thermonuclear weapons testing, cultural disruption, political status, and access to healthcare.<sup>15–17</sup>

Attention to social determinants provides a wider perspective of health and wellness that encompasses the health care system but extends beyond for a broader approach to addressing cancer disparities and health equity. Examples of social determinant indicators for Guam are the poverty rate at 23%, education status, and income. In 2010, 20.4% of persons aged 25 and above had a bachelor's degree or higher. Income data show median household income at \$39,052 with an average household size estimated at 3.8. Household per capita income was \$12,864. Nedicaid and Medically Indigent Program (MIP) payments comprised 31% of insurance payments to Guam Memorial Hospital, highlighting the use and continued need for health care insurance for low-income families. Consideration of social determinants like these highlight the relationships between living conditions, environment, and health outcomes. Examining social determinants of health does not disregard biologically determined factors or individual health-related behaviors. Rather, it puts these in comprehensive context of socioeconomics, culture, history, environment, and policy.

# COMMON CANCERS IN GUAM LUNG AND BRONCHUS CANCER

The leading cause of cancer deaths in men and women worldwide is lung cancer.<sup>22</sup> From 2013- 2017, lung cancer accounted for about 16% of all new cancer cases and about 28% of all cancer deaths in Guam (Table 11).

Table 11. Incidence and mortality from cancer of the lung and bronchus, Guam, 2013-2017

	Count	Percentage
Incidence (New cases)	261	16.4
Mortality (Deaths)	222	27.5

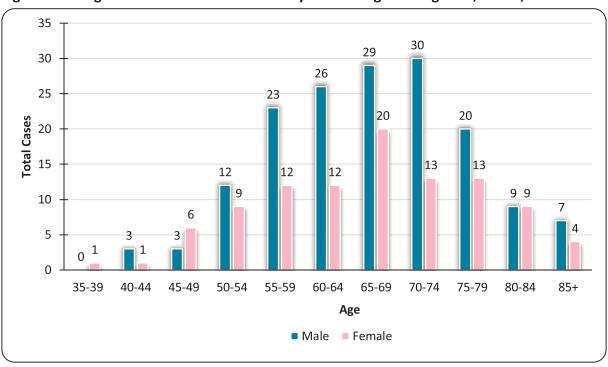

Invasive cases only.

Source: UOG Cancer Research Center, PRCCR.

#### LUNG CANCER BY SEX AND AGE

Figure 10 illustrates the distribution of lung and bronchus cancer cases by sex and age at diagnosis for the 2013-2017 time period. Lung and bronchus cancer cases increased with age with the majority of cases occurring between the ages of 50 to 79 years of age (Figure 10).

Figure 10. Lung and Bronchus Cancer Cases by Sex and Age at Diagnosis, Guam, 2013-2017

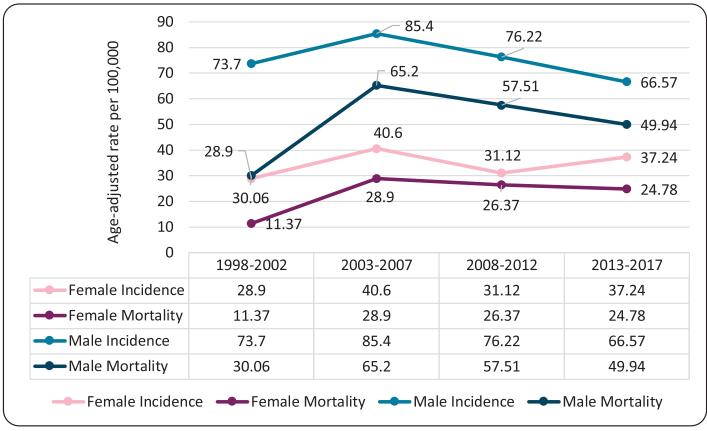

Invasive cases only.

Source: UOG Cancer Research Center, PRCCR.

As with previous time periods, male incidence and mortality for lung and bronchus cancer were higher than female incidence and mortality for the 2013-2017 time period (Figure 11).

Figure 11. Lung & Bronchus Cancer Incidence and Mortality by Sex, Guam: 1998-2017

1998-2017: All cancer cases, 2013-2017: Invasive cases only.

Rates are per 100,000 and are age-adjusted to the 2000 U.S. stanard population.

#### LUNG CANCER BY STAGE DISTRIBUTION

The majority of lung and bronchus cancer cases reported during the 2013-2017 time period were late stage or unstaged (Figure 12). Filipinos had the highest percentage of late stage diagnosis (44.9) and Micronesians had the highest percentage of unstaged lung cancer (61.9).

100 90 80 44.1 44.7 44.9 70 61.9 60 Percent 50 40 37.8 38.9 44.9 30 33.3 20 10 18.2 16.4 10.2 4.8 0 CHamoru Filipino Micronesian **Total Guam** Unstaged 44.1 44.9 61.9 44.7 Late 37.8 44.9 33.3 38.9 ■ Early 18.2 10.2 4.8 16.4 ■ Early ■ Late ■ Unstaged

#### RISK FACTORS FOR LUNG CANCER<sup>23</sup>

- Cigarette smoking
- Exposure to secondhand smoke
- Radiation exposure
- Occupational exposure to lung carcinogens
- Air pollution

The major cause of lung cancer is cigarette smoking.<sup>23</sup> The prevalence of smoking by adults in Guam remained higher than that for their U.S. counterparts (Figure 13 and 14). As seen in the U.S., a higher percentage of adult males than adult females were current smokers in Guam (Figure 14).

<sup>\*</sup>Rates were suppressed if fewer than five cases were recorded.

40 35 31 30.5 29.3 27.4 27.4 26.5 30 25.8 25.8 25.1 24.1 26.4 **bercent** 25 20 15 25 21.2 17.1 19.8 19.6 19 18.4 18.1 17.9 17.4 17.5 17.1 10 5 0 2007 2008 2009 2010 2011 2012 2013 2014 2015 2016 2017 Year -Guam -US

Figure 13. Smoking Prevalence Adults, Guam vs US, 2007-2017

Data source: Behavioral Risk Factor Surveillance System, U.S. CDC.

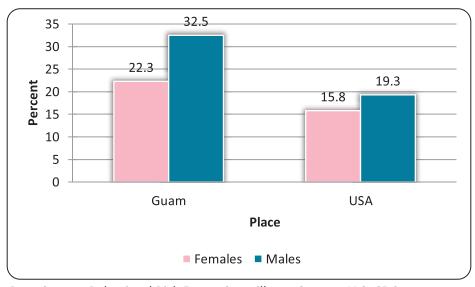

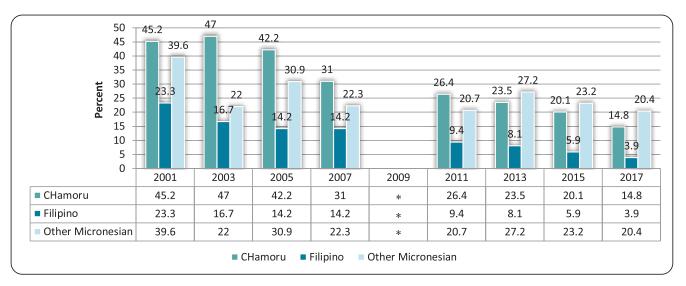

Figure 14. Current smoking adults by sex, Guam vs US, 2015

Data Source: Behavioral Risk Factor Surveillance System, U.S. CDC.

Figure 15 illustrates the percentage of high school teens by ethnicity who reported smoking from 2001 through 2017. The percentage of CHamoru and Filipino high school students who report smoking has decreased through the years whereas the percentage of Other Micronesian high school students who report smoking initially decreased but then appears to be plateauing in the 20+ percentage range (Figure 15). Although the percentage of CHamoru high school students who report smoking has decreased through the years, the percentage of them smoking was comparable to Other Micronesians from 2011 through 2015 (Figure 15).

Figure 15. Current smoking, high school teens by ethnicity, Guam, 2001-2017

<sup>\*</sup>No data available for the year 2009.

Source: Youth Risk Behavioral Surveillance System, 2001-2017.

### COLORECTAL CANCER

The second most common cancer in females and the third most common cancer in males worldwide is colorectal cancer. It is the third most common cancer in males and females in the U.S.<sup>24</sup> From 2013-2017, colorectal cancer accounted for about 11% of all new cancer cases and about 10% of all cancer deaths in Guam (Table 15).

Table 15. Incidence and mortality from colorectal cancer (including anus), Guam, 2013-2017

	Count	Percentage
Incidence (New cases)	177	11.2
Mortality (Deaths)	82	10.2

Invasive cases only.

UOG Cancer Research Center - Colorectal Cancer Awareness (2018)

## COLORECTAL CANCER BY SEX AND AGE

Figure 16 illustrates the distribution of colorectal cancer cases by sex and age at diagnosis for the 2013-2017 time period. The number of colorectal cancer cases increased from age 45 years and up for both men and women (Figure 19).

Figure 16. Colorectal Cancer Cases by Sex and Age at Diagnosis, Guam, 2013-2017

All cases are invasive.

Source: UOG Cancer Research Center, PRCCR.

As with previous time periods, male incidence and mortality for colorectal cancer were higher than female incidence and mortality for the 2013-2017 time period (Figure 17).

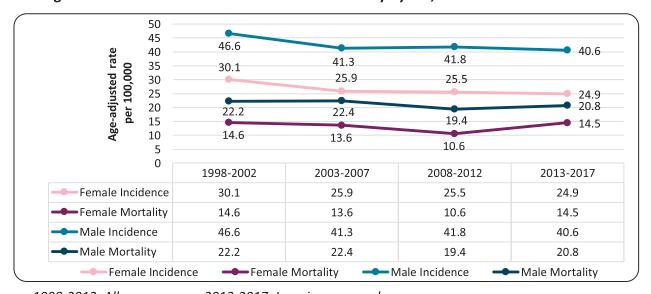

Figure 17. Colorectal cancer incidence and mortality by sex, Guam: 1998-2017

1998-2012: All cancer cases, 2013-2017: Invasive cases only.

Rates are per 100,000 and are age-adjusted to the 2000 U.S. standard population.

Source Years 2013-2017: UOG Cancer Research Center, PRCCR.

Colorectal cancer accounted for about 13% of all new cancer cases in males and about 9% of all new cancer cases in females. Colorectal cancer was the cause of about 10% of cancer deaths in both males and females (Table 16).

Table 16. Incidence and mortality from colorectal cancer by sex, Guam, 2013-2017

	Counts	Percentage	Counts	Percentage
Female	71	9.1	35	10.0
Male	106	13.2	47	10.3

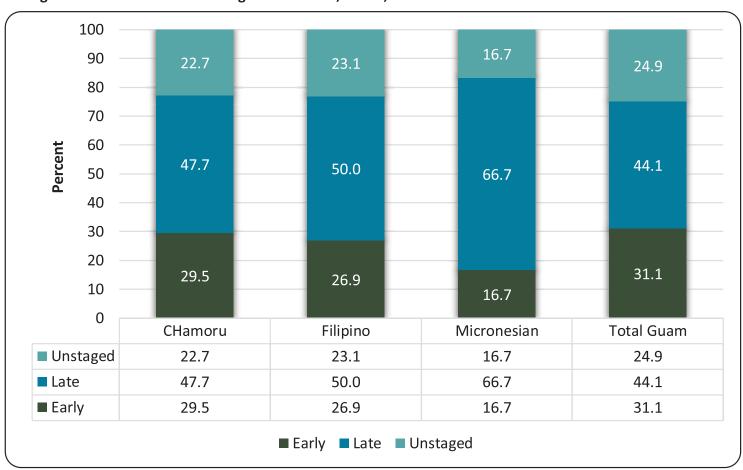

Invasive cases only.

Source: UOG Cancer Research Center, PRCCR.

#### COLORECTAL CANCER BY STAGE DISTRIBUTION

The majority of colorectal cancer cases reported during the 2013-2017 time period were either late stage or unstaged (Figure 18). Micronesians had the highest percentage of late stage diagnosis in colorectal cancer (66.7) and Filipinos had the highest percentage of unstaged colorectal cancer (23.1).

Figure 18. Colorectal Cancer Stage Distribution, Guam, 2013-2017

All cases are invasive.

#### COLORECTAL CANCER BY ETHNICITY

When comparing Guam's cancer incidence rates for colorectal cancer by ethnicity, Caucasians and CHamorus had higher rates than that reported for the total Guam population and the total U.S. (Table 17).

Table 17. Comparison of Guam and US mean annual age-adjusted cancer incidence rates for colorectal cancer by ethnicity, 2013-2017

Cancer Site	CHamoru	Filipino	Micronesian	Caucasian	Asian (other than Filipino)	Total Guam	Total U.S.
Colon and Rectum	41.0	25.8	8.7	47.5	11.4	32.3	40.3

2013-2017: Invasive cases only.

Rates are per 100,000 and are age-adjusted to the 2000 U.S. standard population.

Source Years 2013-2017: UOG Cancer Research Center, PRCCR.

When comparing Guam's cancer mortality rates by ethnicity Caucasians and CHamorus had the highest mortality rate for colorectal cancer. Additionally, Caucasians and CHamorus had a higher mortality rate for colorectal cancer than that reported for the total Guam population and the total U.S. (Table 18).

Table 18. Comparison of Guam mean annual age-adjusted cancer mortality rates for colorectal cancer by ethnicity for 2013-2017 with the 2010 US aggregrate age-adjusted cancer mortality rate

Cancer Site	CHamoru	Filipino	Micronesian	Caucasian	Asian (other than Filipino)	Total Guam	Total U.S.
Colon and Rectum	23.2	12.8	11.5	26.6	15.2	17.3	14.2

Invasive cases only.

## RISK FACTORS FOR COLORECTAL CANCER<sup>25</sup>

- Excessive alcohol use
- Cigarette smoking
- Obesity
- Famiy/personal history of colorectal cancer and other hereditary conditions

# FACTOR THAT DECREASES RISK OF COLORECTAL CANCER<sup>25</sup>

Physical activity

Guam Comprehensive Cancer Control -Celebrate Life! Cancer Survivors Conference (2016)

<sup>\*</sup>Rates were suppressed if fewer than five cases were recorded.

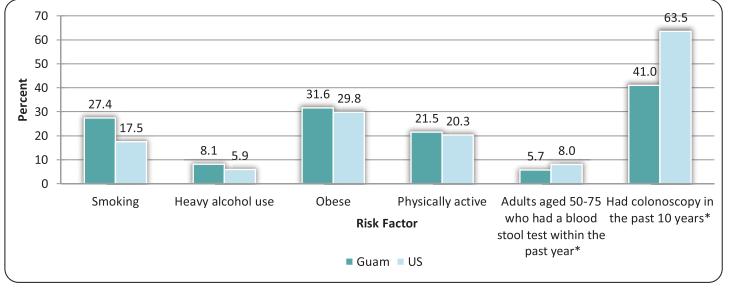

<sup>\*</sup>Rates are suppressed if fewer than five (5) cases were recorded in the cancer site category.

# GUAM CANCER FACTS & FIGURES 2013-2017

From 2015-2016, Guam's population reported higher rates of smoking and slightly higher rates of heavy alcohol use and obesity than the U.S. population (Figure 19). Smoking, excessive alcohol use, and obesity are all modifiable factors that increase one's risk for colorectal cancer.

Physical activity decreases one's risk of developing colorectal cancer, and from 2015-2016, Guam's population reported slightly higher rates of physical activity than the U.S. population (Figure 19).

Figure 19. Prevalence of factors affecting colorectal cancer, Guam vs US, 2015-2016

<sup>\*</sup>Data from 2016.

Data Source: Behavioral Risk Factor Surveillance System, U.S. CDC (2015-2016).

Stool tests and colonoscopy are methods for screening for colorectal cancer. Guam's population reported lower screening participation in colonoscopy in the past 10 years and slightly less participation in stool test within the past year than the U.S. population from 2015- 2016 (Figure 19).

UOG Cancer Research Center - Health Providers Cancer Symposium (2019)

## LIVER CANCER

The sixth most diagnosed cancer worldwide is liver cancer.<sup>26</sup> From 2013-2017, liver cancer accounted for about 5% of all new cancer cases and about 10% of all cancer deaths in Guam (Table 19).

Table 19. Incidence and mortality from cancer of the liver, Guam 2013-2017

	Count	Percentage
Incidence (New cases)	78	4.9
Mortality (Deaths)	79	9.8

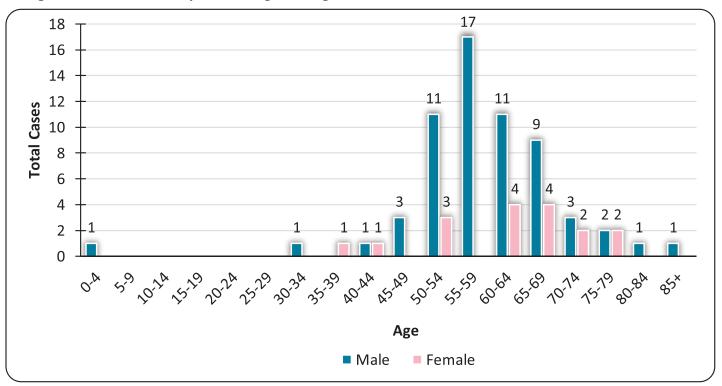

Invasive cases only.

Source: UOG Cancer Research Center, PRCCR.

#### LIVER CANCER BY SEX AND AGE

Figure 16 illustrates the distribution of liver cancer cases by sex and age at diagnosis for the 2013-2017 time period. The majority of cases during this time period occurred in men between the ages of 50 to 69 years old (Figure 20).

Figure 20. Liver Cancer by Sex and Age at Diagnosis, Guam, 2013-2017

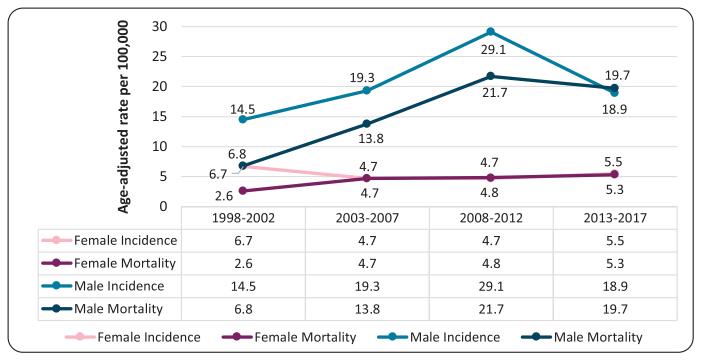

All cases are invasive.

Source: UOG Cancer Research Center, PRCCR.

As with previous time periods, male incidence and mortality for liver cancer were higher than female incidence and mortality for the 2013-2017 time period (Figure 21).

Figure 21. Liver Cancer Incidence and Mortality, Guam, 1998-2017

1998-2012: All cancer cases, 2013-2017: Invasive cases only.

Rates are per 100,000 and are age-adjusted to the 2000 U.S. standard population.

For the 2013-2017 time period, liver cancer accounted for about 8% of all new cancer cases in males and about 2% of all new cancer cases in females. For the same time period, liver cancer was the cause of 14% of cancer deaths in males and about 5% of cancer deaths in females (Table 20).

Table 20. Incidence and mortality from cancer of the liver by sex, Guam, 2013-2017

	Inci	dence	Mortality		
	Counts	Percentage	Counts	Percentage	
Female	17	2.2	17	4.8	
Male	61	7.6	62	13.6	

Invasive cases only.

#### LIVER CANCER BY STAGE DISTRIBUTION

Most liver cancer cases reported during the 2013-2017 time period were late or unstaged (Figure 22). All cases for liver cancer among Micronesians were unstaged.

Figure 22. Liver cancer stage distribution, Guam, 2013-2017

All cases are invasive.

Source: UOG Cancer Research Center, PRCCR,

## LIVER CANCER BY ETHNICITY

When comparing Guam's liver cancer incidence rates by ethnicity, Micronesians had 3 times the rate for the total Guam population and 4.6 times the U.S. rate. CHamorus had incidence rates 1.8 times the total Guam population and 2.8 times the U.S. rate. Additionally, the incidence rate for liver cancer for the total Guam population was higher than that reported for the total U.S. (Table 21).

Table 21. Comparison of Guam and US mean annual age-adjusted cancer incidence rates for cancer of the liver by ethnicity, 2013-2017

Cancer Site	CHamoru	Filipino	Micronesian	Caucasian	Asian	Total Guam	Total U.S.
Liver	22.0	2.2	36.2	*	*	12.1	7.8

2013-2017: Invasive cases only.

Rates are per 100,000 and are age-adjusted to the 2000 U.S. standard population.

Source Years 2013-2017: UOG Cancer Research Center, PRCCR.

<sup>\*</sup>Rates were suppressed if fewer than five cases were recorded.

When comparing Guam's liver cancer mortality rates by ethnicity, Micronesians and CHamorus had much higher rates than that reported for the total Guam population and the total U.S. Additionally, the mortality rates for liver cancer for the total Guam population were higher than that reported for the total U.S. (Table 22).

Table 22. Comparison of Guam mean annual age-adjusted cancer mortality rates for liver by ethnicity for 2013-2017 with the 2010 US aggregate age-adjusted cancer mortality rate

Cancer Site	CHamoru	Filipino	Micronesian	Caucasian	Asian (other than Filipino)	Total Guam	Total U.S.
Liver	22.7	2.6	25.2	*	*	12.1	4.9

Invasive cases only.

Rates are per 100,000 and are age-adjusted to the 2000 U.S. standard population.

## RISK FACTORS FOR LIVER CANCER<sup>27</sup>

- Chronic hepatitis B infection
- Chronic hepatitis C infection
- Cirrhosis
- Heavy alcohol use
- Aflatoxin B1 exposure
- Nonalcoholic steatohepatitis (NASH)
- Cigarette smoking
- Certain genetic and medical conditions: untreated hereditary hemochromatosis, alpha1-antitrypsin deficiency, glycogen storage disease, porphyria cutanea tarda, Wilson disease

### **BREAST CANCER**

Breast cancer is the leading cancer diagnosis and leading cause of cancer death in women worldwide.<sup>28</sup> From 2013-2017, breast cancer accounted for about 17% of all new cancer cases and about 9% of all cancer deaths in Guam (Table 23). Breast cancer was the most frequently reported site for new cancer cases in females and the second leading cause of cancer deaths in females in Guam (Table 7 and Table 8).

Table 23. Incidence and mortality from cancer of the breast, Guam 2013-2017

	Count	Percentage
Incidence (New cases)	267	16.8
Mortality (Deaths)	69	8.6

Invasive cases only.

<sup>\*</sup>Rates are suppressed if fewer than five cases were recorded in the cancer site category.

#### BREAST CANCER BY AGE

Figure 23 illustrates the distribution of breast cancer by age at diagnosis for the 2013-2017 time period. Most cases during this time period occurred between the ages of 40 to 74 years old (Figure 23).

50 43 45 39 40 36 35 **Total Cases** 29 29 30 26 25 21 20 15 15 10 8 10 40-44 45-49 50-54 55-59 60-64 65-69 Age

Figure 23. Breast Cancer Cases by Age at Diagnosis, Guam, 2013-2017

All cases are invasive.

Source: UOG Cancer Research Center, PRCCR.

The breast cancer incidence rate in the 2013-2017 time period decreased by 8% compared to the 2008-2012 time period (Figure 24). This may be in part due to the data from 2013-2017 time period including only invasive cases versus the previous time periods that included all cancer cases. Breast cancer mortality was 2.1 times the 2008-2012 rate (Figure 24).

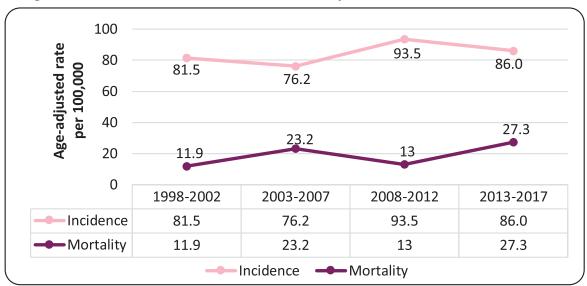

Figure 24. Breast Cancer Incidence and Mortality, Guam, 1998-2017

1998-2012: All cancer cases, 2013-2017: Invasive cases only.

Rates are per 100,000 and are age-adjusted to the 2000 U.S. standard population.

Source Years 2013-2017: UOG Cancer Research Center, PRCCR.

Source Years 2003-2012: Guam Cancer Facts and Figures 2003-2007: Guam Cancer Facts and Figures 2008-2012.

#### BREAST CANCER BY STAGE DISTRIBUTION

The majority of breast cancer reported was early stage (Figure 25 and Figure 26). CHamorus had the highest percentage of early stage distribution (66.4) and Micronesians had the highest percentage of late stage distribution (59.1) (Figure 25). Figure 26 includes data for in situ cases.

#### BREAST CANCER BY ETHNICITY

When comparing Guam's cancer incidence rates for breast (female) cancer by ethnicity, Micronesians had the highest incidence and their rate was higher than that reported for the total Guam population and total U.S. Caucasians and CHamorus had a higher incidence rate for breast (female) cancer than that reported for the total Guam population (Table 24).

Table 24. Comparison of Guam and US mean age-adjusted cancer incidence rates for cancer of the breast (female) by ethnicity, 2013-2017

Cancer Site	CHamoru	Filipino	Micronesian	Caucasian	Asian (other than Filipino)	Total Guam	Total U.S.
Breast (Female)	94.0	59.8	137.5	121.9	46.7	86.6	126.8

2013-2017: Invasive cases only.

\*Rates were suppressed if fewer than five cases were recorded.

Rates are per 100,000 and are age-adjusted to the 2000 U.S. standard population.

Source Years 2013-2017: UOG Cancer Research Center, PRCCR.

When comparing Guam's cancer mortality rates by ethnicity, Micronesians had the highest mortality rate for breast (female). Micronesians had a mortality rate for breast cancer (female) that was 3.8 times the rate reported for the total Guam population and 5.1 times the total U.S rate. Caucasians also had a high mortality rate that was 2.8 times the total Guam rate and 3.8 times the total U.S rate. Additionally, the mortality rate for breast cancer for the total Guam population was 34.5% higher than that reported for the total U.S. (Table 25).

Guam Comprehensive Cancer Control -Breast Cancer Awareness (2016)

Table 25. Comparison of Guam mean annual age-adjusted cancer mortality rates for breast (female) by ethnicity for 2013-2017 with the 2010 US aggregate age-adjusted cancer mortality rate

## **CANCER FACTS & FIGURES 2013-2017**

## FACTORS FOR BREAST CANCER<sup>29</sup>

- Female sex
- Older age
- Family history, especially in first-degree relative
- Dense breasts
- Menopausal hormone therapy
- Combination hormone therapy
- Estrogen therapy
- Ionizing radiation
- Obesity
- Alcohol consumption

## FACTORS THAT DECREASE RISK OF BREAST CANCER<sup>29</sup>

- Full-term pregnancy before the age of 20 years old
- Breastfeeding
- Exercise
- Estrogen use by women with prior hysterectomy

## **PROSTATE CANCER**

Eleven percent of men in the U.S. will have prostate cancer at one point in their lifetime.<sup>30</sup> From 2013-2017, prostate cancer accounted for 11% of all new cancer cases and about 6% of all cancer deaths in Guam (Table 26). Prostate cancer was the most frequently reported site for new cancer cases in males and the third leading cause of cancer deaths in males in Guam (Table 7 and Table 8).

Table 26. Incidence and mortality from cancer of the prostate, Guam, 2013-2017

	Count	Percentage
Incidence (New cases)	175	11.0
Mortality (Deaths)	49	6.1

Invasive cases only.

Source: UOG Cancer Research Center, PRCCR.

The incidence of prostate cancer in Guam appears to be decreasing over time (Figure 27). The incidence rate decreased by 10.2% compared to the 2008-2012 period. The prostate cancer mortality rate increased by 75% compared to the 2008-2012 period (Figure 27).

120 Age-adjusted rate per 100,000 113.3 100 80 82.1 73.7 65.6 60 33 40 31.7 18.1 20 9.6 0 1998-2002 2003-2007 2008-2012 2013-2017 65.6 Incidence 113.3 82.1 73.7 Mortality 31.7 9.6 33 18.1 Incidence Mortality

Figure 27. Prostate Cancer Incidence and Mortality, Guam, 1998-2017

### PROSTATE CANCER BY STAGE DISTRIBUTION

More than 50% of prostate cancer cases were early stage across ethnicities (Figure 29). CHamorus had the highest percentage of early stage prostate cancer (75.0). Micronesians had the highest percentage of late stage diagnosis (28.6) and Filipinos had the highest percentage of unstaged prostate cancer (17.9).

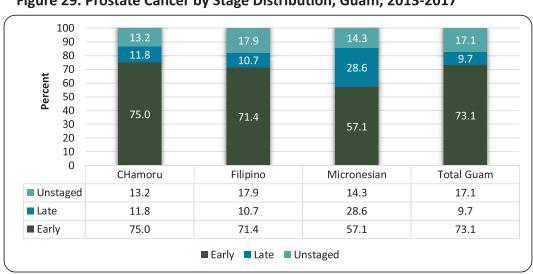

Figure 29. Prostate Cancer by Stage Distribution, Guam, 2013-2017

All cases are invasive.

#### PROSTATE CANCER BY ETHNICITY

When comparing Guam's cancer incidence rates for prostate cancer by ethnicity, Micronesians had the highest incidence and their rate was higher than that reported for the total Guam population and the total U.S. Caucasians had the second highest incidence for prostate cancer and their rate was higher than that reported for the total Guam population and the total U.S. CHamorus also had a higher incidence of prostate cancer than the rate reported for the total Guam population (Table 27).

Table 27. Comparison of Guam and US mean annual age-adjusted cancer incidence rates for cancer of the prostate by ethnicity, 2013-2017

Cancer Site	CHamoru	Filipino	Micronesian	Caucasian	Asian (other than Filipino)	Total Guam	Total U.S.

## FACTORS FOR PROSTATE CANCER<sup>31</sup>

- Older age
- Family history, especially in first-degree relative
- Hormones
- Dietary fat
- Dairy and calcium intake
- Folic acid

<sup>\*</sup>Rates were suppressed if fewer than five cases were recorded.

<sup>\*</sup>Rates were suppressed if fewer than five cases were recorded.

## **PANCREATIC CANCER**

In the U.S., cancer of the pancreas is the fourth leading cause of cancer deaths.<sup>32</sup> In Guam, pancreatic cancer was the sixth leading cause of cancer deaths and accounted for about 4% of all cancer deaths (Table 29). Pancreatic cancer ranked eighth for new cancer cases in females and tenth for new cancer cases in males (Table 7).

Table 29. Mortality from cancer of the pancreas, Guam, 2013-2017

	Count	Percentage
Mortality (Deaths)	30	3.7

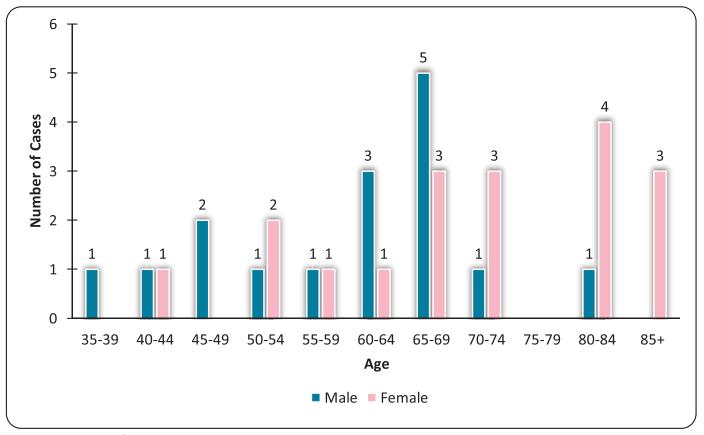

Invasive cases only.

#### RISK FACTORS FOR PANCREATIC CANCER33

The NCI does not list evidence-based information specific to pancreatic cancer but has provided general cancer prevention risk factors below.

- Cigarette smoking and tobacco use
- Infections
- Radiation
- Immunosuppression after organ transplantation

## **MOUTH AND PHARYNX CANCER**

From 2013-2017, mouth and pharynx cancer was the seventh most common cancer site for new cases and the seventh most common cause of cancer deaths in Guam. During the same time period, mouth and pharynx cancer accounted for about 3% of all new cancer cases and about 3% of all cancer deaths in Guam (Table 33).

Table 33. Incidence and mortality from cancer of the mouth and pharynx, Guam 2013-2017

	Count	Percentage
Incidence (New cases)	50	3.2
Mortality (Deaths)	24	3.0

*Invasive cases only.*

### CERVICAL CANCER

Cervical cancer is a common cancer in females worldwide.<sup>35</sup> Cervical cancer accounted for about 3% of all cancer deaths in Guam (Table 38). During the same time period, cervical cancer was the fifth leading site for new cancer cases in females and the fifth leading cause of cancer deaths in females in Guam (Table 7 and Table 8).

Table 38. Mortality from cancer of the cervix, Guam, 2013-2017

	Count	Percentage of all cancer deaths
Mortality (Deaths)	20	2.5

Invasive cases only.

Guam Comprehensive Cancer Control Coalition- Cervical Cancer Conference (2017)

<sup>\*</sup>Rates are suppressed if fewer than five (5) cases were recorded in the cancer site category.

# GUAM CANCER FACTS & FIGURES 2013-2017

During the 2013-2017 time period, cervical cancer incidence in Guam decreased relative to the 2008-2012 time period and was comparable to the rate seen in the 2003-2007 time period. The move to include only invasive cases for the 2013-2017 time period versus all cancer cases in the previous time periods may have contributed to the decreased incidence observed for the 2013- 2017 time period. During the 2013-2017 time period, cervical cancer mortality increased relative to the previous time periods (Figure 36).

40 35.8 Age-adjusted rate 35 30 25 20 15 13.4 9.5 10 9.8 2.5 5 3.7 6.7 5.1 0 1998-2002 2003-2007 2008-2012 2013-2017 Incidence 13.4 9.5 35.8 9.8 Mortality 3.7 5.1 2.5 6.7 Incidence Mortality

Source Years 2013-2017: UOG Cancer Research Center, PRCCR.

When comparing Guam's cancer mortality rates by ethnicity, Micronesians had the highest rates for the cervix. Micronesians had a mortality rate for cervical cancer 3.3 times higher than that reported for the total Guam population and 9.7 times higher than the total U.S. Additionally, the mortality rate for cervical cancer for the total Guam population was almost three times higher than the total U.S. (Table 40).

Table 40. Comparison of Guam mean annual age-adjusted cancer mortality rates for cervix by ethnicity for 2013-2017 with the 2010 US aggregate age-adjusted cancer mortality rate

Cancer Site	CHamoru	Filipino	Micronesian	Caucasian	Asian (other than Filipino)	Total Guam	Total U.S.
Cervix	6.4	6.2	22.3	*	*	6.7	2.3

2013-2017: Invasive cases only.

Rates are per 100,000 and are age-adjusted to the 2000 U.S. standard population.

<sup>\*</sup>Rates are suppressed if fewer than five cases were recorded.

<sup>\*</sup>Rates are suppressed if fewer than five cases were recorded in the cancer site category.

#### RISK FACTORS FOR CERVICAL CANCER<sup>36</sup>

- Human Papillomavirus (HPV) infection
- Immunosuppression
- Sexual activity at an early age and with an increased number of sexual partners
- Seven or more full term pregnancies
- Long-term use of oral contraceptives
- Both active and passive cigarette smoke exposure
- Diethylstilbestrol (DES) exposure

# FACTOR THAT DECREASES RISK OF CERVICAL CANCER<sup>36</sup>

Sexual abstinence

# INTERVENTIONS WITH ADEQUATE EVIDENCE OF A DECREASED RISK OF CERVICAL CANCER<sup>36</sup>

HPV Vaccination

UOG Cancer Research Center - Cervical Cancer Screening & HPV Vaccination (2017)
